

Meeting Review Report Generator - Project Documentation

Overview

The Meeting Review Report Generator is a sophisticated Claude project designed to transform raw meeting recording traces into professional, actionable business documentation. Acting as a senior business analyst with over 20 years of experience, this system intelligently processes meeting content to identify participants, extract key themes, track decisions and action items, and generate comprehensive reports that serve as permanent records of meeting outcomes.

This project bridges the gap between conversational meeting content and structured business intelligence, enabling teams to maintain clear documentation, track progress over time, and ensure accountability for action items. The system supports multilingual output and multiple export formats, making it adaptable to diverse organizational needs and international teams.

Key Features

Participant Analysis

- **Automatic identification** of all meeting participants from traces
- **Role extraction** and contribution tracking
- **Contextual understanding** of participant relationships and dynamics

Theme Extraction & Categorization

- **Intelligent theme identification** from conversational content
- **Relevance inference** based on discussion depth, time spent, and participant engagement
- **Hierarchical organization** of themes with logical dependencies
- **Technical context preservation** for specialized discussions

Historical Context Integration

- **Optional historical report analysis** to track theme evolution
- **Progress tracking** across multiple meetings
- **Trend identification** and advancement measurement
- **Continuity maintenance** across reporting periods

Decision & Action Tracking

- **Comprehensive decision documentation** with context and rationale
- **Open point identification** requiring further discussion or research
- **Action item extraction** with clear assignees and deadlines
- **Critical aspect highlighting** for risk and priority management

Dependency Mapping

- **Logical dependencies** between related themes
- **Temporal relationships** showing sequences and prerequisites
- **Organizational dependencies** across teams or departments
- **Cross-reference system** for interconnected topics

Professional Report Generation

- **Four-section structure:** Introduction, Discussed Themes, Summary, Follow-up
- **Proportional detail levels** based on theme relevance
- **Strategic formatting** with bold text, bullets, and numbered lists
- **Executive-ready presentation** suitable for stakeholder distribution

Multilingual Support

- **Default Italian output** with support for other languages
- **Language selection** at report generation time
- **Consistent terminology** across selected language
- **Cultural appropriateness** in phrasing and tone

Multiple Export Formats

- **DOCX** for collaborative editing and Word-based workflows
- **PDF** for formal distribution and archival
- **Markdown** for version control and lightweight sharing

Input Requirements

Primary Input: Meeting Recording Traces

Meeting traces should contain:

- **Conversational content** from the meeting (verbatim or summarized)
- **Participant information** (names, roles if available)
- **Timestamps** (optional but helpful for sequencing)
- **Technical details** discussed during the meeting
- **Decisions made** and actions assigned

Accepted formats: Text files, transcripts, structured notes, or any textual representation of the meeting

Optional Input: Historical Reports

Previous meeting reports can be provided to:

- **Track theme evolution** across multiple meetings
- **Identify recurring topics** and their progression
- **Measure advancement** on previously discussed items
- **Maintain continuity** in reporting style and structure
- **Cross-reference** related discussions from past meetings

Output Structure

1. INTRODUCTION

Purpose: Provide a concise overview of the meeting's primary focus and context

Content includes:

- Meeting date and participants

- Main objective or purpose of the meeting
- High-level context setting
- Scope of discussion covered

Length: Brief (1-3 paragraphs)

2. DISCUSSED THEMES

Purpose: Present detailed analysis of each theme discussed in the meeting

Structure: One dedicated subsection per theme

Detail levels (proportional to relevance):

- **High relevance:** Comprehensive coverage with technical details, full context, decisions, actions, and dependencies
- **Medium relevance:** Moderate detail focusing on key points, decisions, and outcomes
- **Low relevance:** Brief mention with essential information only

Each theme subsection includes:

- **Theme title** (clear and descriptive)
- **Context and background** (why this theme was discussed)
- **Technical details** (specifications, requirements, constraints)
- **Discussion points** (key arguments, considerations, perspectives)
- **Decisions made** (highlighted prominently)
- **Open points** (items requiring further discussion)
- **Action items** (with assignees when identified)
- **Dependencies** (relationships to other themes)
- **Critical aspects** (risks, priorities, constraints)

3. SUMMARY

Purpose: Provide a comprehensive recap consolidating all key outcomes

Content includes:

- **Decisions recap:** All decisions made across all themes
- **Open points list:** Consolidated list of items requiring follow-up discussion
- **Actions overview:** Summary of all action items with assignees
- **Critical aspects:** Highlighted risks, priorities, and constraints
- **Overall progress:** Assessment of advancement when historical context available

Structure: Organized by category (decisions, open points, actions) for easy reference

4. FOLLOW-UP

Purpose: Provide clear, actionable next steps with accountability

Content includes:

- **Action items:** Specific tasks to be completed
- **Assignees:** Clear responsibility assignment
- **Deadlines:** Time expectations when specified
- **Dependencies:** Prerequisites for each action
- **Priority levels:** Urgency and importance indicators
- **Success criteria:** How completion will be measured

Format: Actionable list optimized for task tracking and project management

Analysis Methodology

Theme Identification Process

1. **Content review:** Systematic analysis of meeting traces
2. **Topic clustering:** Grouping related discussion points
3. **Theme naming:** Creating clear, descriptive titles
4. **Context extraction:** Capturing surrounding information

Relevance Inference

Relevance levels are inferred from:

- **Discussion time:** Amount of meeting time devoted to theme
- **Participant engagement:** Level of interaction and debate
- **Decision outcomes:** Whether decisions were made
- **Action generation:** Number of actions assigned
- **Technical depth:** Complexity and detail of discussion
- **Explicit indicators:** Keywords like "critical," "priority," "important"

Dependency Analysis

Dependencies are identified through:

- **Logical relationships:** One theme building on another
- **Temporal sequences:** Order of implementation or discussion
- **Resource sharing:** Common teams, budgets, or tools
- **Risk propagation:** How one theme affects another
- **Prerequisite identification:** What must happen first

Historical Integration

When previous reports are provided:

- **Theme matching:** Identifying recurring topics across meetings
- **Progress measurement:** Assessing advancement on previous actions
- **Trend analysis:** Noting evolution of themes over time
- **Continuity:** Maintaining consistent treatment of ongoing topics

Language and Format Options

Language Selection

- **Default:** Italian
- **Process:** User is asked to select language before report generation
- **Application:** Entire report generated in selected language
- **Consistency:** Terminology maintained throughout document

Format Options

DOCX (Microsoft Word)

- **Best for:** Collaborative editing, commenting, track changes
- **Features:** Full formatting, tables, headers, footers
- **Use case:** Internal review, iterative refinement

PDF (Portable Document Format)

- **Best for:** Formal distribution, archival, unchangeable records
- **Features:** Professional appearance, universal compatibility
- **Use case:** Executive reports, official documentation

MD (Markdown)

- **Best for:** Version control, lightweight sharing, technical teams
- **Features:** Plain text with formatting, easy diff tracking
- **Use case:** Git repositories, developer documentation

Workflow

Step-by-Step Process

Step 1: Input Submission

- User uploads meeting recording trace(s) as attachment(s)
- Optionally: User uploads previous meeting reports for context

Step 2: Language Selection

- System prompts user to select document language
- Default option: Italian
- User confirms selection

Step 3: Format Selection

- System prompts user to select output format
- Options: DOCX, PDF, MD
- User confirms selection

Step 4: Analysis Phase

- System reads and processes meeting trace(s)
- Identifies participants and their roles
- Extracts all discussed themes
- Infers relevance levels
- Maps dependencies between themes
- Tracks decisions, actions, and open points
- If historical reports provided: analyzes progress and evolution

Step 5: Report Generation

- System structures content according to four-section format

- Applies proportional detail levels based on relevance
- Formats document according to selected export format
- Applies bold text, bullets, and lists strategically
- Ensures logical flow and cross-references

Step 6: File Creation

- System reads relevant skill documentation for format
- Generates document in selected format
- Places file in /mnt/user-data/outputs/ directory
- Provides download link using computer:// protocol

Step 7: Delivery

- User receives download link
- User can review and download report
- Report is ready for distribution

Best Practices

For Optimal Input Quality

Meeting Traces:

- Provide as complete information as possible
- Include participant names and roles when known
- Capture technical details and specific terminology
- Note any decisions made during discussion
- Record action items assigned during meeting

Historical Reports:

- Include immediately previous meeting report for continuity
- Provide reports from related meeting series
- Ensure consistent participant naming across reports

For Better Analysis Results

Theme Extraction:

- Ensure meeting traces capture full context of discussions
- Include technical specifications and requirements
- Note any constraints or limitations discussed
- Capture stakeholder concerns and priorities

Dependency Identification:

- Provide information about project timelines
- Include details about team structures
- Note shared resources or dependencies
- Mention prerequisites or blockers

For Enhanced Report Quality

Clarity:

- Review generated report for accuracy
- Verify participant names and roles
- Confirm technical details are correct
- Check action item assignments

Formatting:

- DOCX format provides most editing flexibility
- PDF format best for formal distribution
- MD format ideal for technical teams and version control

Distribution:

- Share reports promptly after meetings
- Ensure all participants receive copies
- Archive reports for historical reference
- Track action item completion

For Continuous Improvement

Feedback Loop:

- Note what worked well in generated reports
- Identify missing information in traces
- Refine trace capture process over time
- Build comprehensive historical record

Consistency:

- Use consistent participant naming
- Maintain standard meeting trace format
- Store historical reports systematically
- Review reports regularly for quality

Technical Notes

File Handling

- All generated files are placed in /mnt/user-data/outputs/
- Download links use computer:// protocol
- Files are created using appropriate skill documentation
- Format-specific best practices are applied

Quality Assurance

- No assumptions made without verification
- Technical terms cross-referenced with reliable sources
- Logical flow verified between sections
- Consistent terminology maintained throughout
- Cross-references validated for accuracy

Privacy and Security

- Meeting content processed in secure environment

- No data retained beyond session
 - Reports contain only information from provided inputs
 - User controls all distribution of generated reports
-

Version: 1.0
